

Working with Modern HTML — Quick Reference

Live Server Setup (VS Code)

1. **Extensions** icon → search "**live server**"
2. Install the extension by **Ritwick Dey**
3. Explorer view → left-click `index.html` once
4. Right-click `index.html` → "**Open with Live Server**"

<head> — Metadata Tags

- `<link rel="icon" href="...">` — favicon
- `<title>...</title>` — text shown on the tab
- `<meta property="og:title" content="...">` — Open Graph link-preview title
- `og:image`, `og:description` — other Open Graph preview fields
- **index.html** — default file served when a URL points to a folder (`/2_HTML == /2_HTML/index.html`)

Text-Level Tags — Visual vs. Semantic

- `<b>` bold vs. `<strong>` — important (bold)
- `<i>` italic vs. `<em>` — emphasis (italic)
- `<u>` underline vs. `<ins>` — inserted (underline)
- **Rule of thumb** — semantic tags carry meaning; visual tags only carry style

Semantic vs. Non-semantic Elements

- **Semantic (examples)** — `header`, `nav`, `main`, `article`, `section`, `aside`, `footer`, `figure`
- **Non-semantic** — `div`, `span`

Block vs. Inline Elements

- **Block (examples)** — `div`, `p`, `h1–h6`, `ul`, `ol`, `li`, `section`, `form`
- **Inline (examples)** — `span`, `a`, `strong`, `em`, `b`, `i`, `u`, `img`, `sup`, `sub`

Void Elements & Whitespace

- `<br>` — line break (no closing tag)
- `<hr>` — horizontal rule (no closing tag)
- **Whitespace collapse** — extra spaces/newlines in source HTML render as one single space

Git: Push Changes

1. `git add .`
2. `git commit -m "message"`
3. `git push`
